CASE STUDY - ODOO 19 ERP IMPLEMENTATION

Al-Nour Medical Supplies LLC

Medical Consumables & Equipment Trading · Amman, Jordan · 8 employees · 187,000 JOD annual revenue

Context

Al-Nour was a stable, revenue-generating business that had relied on manual Excel sheets and a standalone accounting system for its day-to-day operations. Over time, this created gaps in inventory accuracy, vendor bill verification, and purchase approval documentation, with no formal audit trail to catch discrepancies before they accumulated.

Team Structure

User	Position / Role
Layali Salahmeh	Administrator / Owner
Lina Haddad	Accountant
Omar Saleh	Purchase Representative
Rami Naser	Warehouse Officer
Sara Khalil	Sales Representative

Consulting scope

As the functional consultant on this engagement, I led the full Odoo 19 implementation across four modules: Inventory, Purchase, Accounting, and Sales , plus Studio customization for demand-driven replenishment. The project covered business analysis, gap identification, system configuration, process redesign, and financial reconciliation before go-live.

Skills demonstrated

Odoo 19 Configuration Inventory Reconciliation Three-Way Matching Approval Workflow Design
Financial Statement Analysis Landed Cost Management Supplier Sourcing Optimization
Studio Customization Lot/Serial Traceability Demand-Driven Replenishment

Key Results

- **2,835** JOD in financial misstatements identified and resolved.
- **910** JOD inventory valuation understatement corrected after physical reconciliation.
- **1,925** JOD in AP discrepancies identified and resolved prior to payment
- Optimized warehouse operations through location structuring, Lot/Serial tracking, and Putaway Rules.
- Improved product profit margins through supplier optimization and lower landed costs, increasing Portable Nebulizer margins from **13%** to **36%**.
- Aligned reordering rules with seasonal demand to optimize stock levels and improve cash flow.
- Identified seasonal revenue drops (from **40,000/45,000** to **12,000/15,000** JOD) and advised the business owner on shifting inventory capital to high-demand clinical products.

> 📌 This is a simulated case study based on realistic business data, created to demonstrate functional consulting skills in Odoo 19.

The Problems

Al-Nour was profitable on paper, but net income was not keeping pace with revenue. The reasons only became clear during the Odoo migration, which triggered a full operational review and surfaced several issues that had been accumulating quietly.

Problem 1 - Inventory Quantities Did Not Match Reality

The physical stock count revealed a 910 JOD gap between system quantities and what was actually on the shelves. Three products were understated and one was overstated. Some receipts were recorded before deliveries were physically confirmed, and in one case, a warehouse employee entered the ordered quantity for Nitrile Gloves rather than what was actually received, a difference of 50 units.

Root Cause: No formal receiving process required staff to validate actual delivered quantities before updating the system. Entries were based on what was ordered, not what arrived.

Product	System Qty	Actual Qty	Difference	Status
Blood Glucose Strips (REF-2241)	130	150	20 units	Excess
Digital Thermometer (THERM-05)	100	100	0	Matched
Portable Nebulizer (NEB-P01)	24	29	5 units	Excess
Nitrile Gloves (GLV-B2)	1,130	1,080	50 units	Shortage
Surgical Masks (MASK-S1)	2,000	2,300	300 units	Excess
Pulse Oximeter (PULSE-V3)	1,140	1,140	0	Matched

Problem 2 - Vendor Bills Did Not Match Purchase Orders

Without a three-way matching process, discrepancies slipped through unnoticed. One supplier added an unapproved training service fee to their invoice for the Portable Nebulizer, raising the unit cost from 85 JOD to 90 JOD. Since Al-Nour is a medical importer and not a healthcare provider, this service was never requested or approved in the original PO. Separately, a bill for Surgical Masks was entered twice into the system. Together, these issues resulted in 1,925 JOD in AP discrepancies, all caught before any payment went out.
Root Cause: Bills were posted directly with no cross-check against the PO or the received quantity. There was no system control to flag cost differences or prevent duplicate entries.

PO Number	Product	PO Unit Cost	Billed Unit Cost	PO vs. Bill
PO-2026-001	Blood Glucose Strips	15.00 JOD	15.00 JOD	No Difference
PO-2026-002	Portable Nebulizer	85.00 JOD	90.00 JOD	+125 JOD billed
PO-2026-003	Surgical Masks	1.20 JOD	1.20 JOD	+1,800 JOD Duplicated
PO-2026-004	Pulse Oximeter	18.00 JOD	18.00 JOD	No Difference
PO-2026-005	Digital Thermometer	5.50 JOD	5.50 JOD	No Difference
PO-2026-006	Nitrile Gloves	3.50 JOD	3.50 JOD	No Difference

Problem 3 - No Approval Workflow or Audit Trail

Purchase orders were approved verbally or over WhatsApp, with no digital record of who approved what and when. This directly enabled the duplicate invoice issue in Problem 2. Both the warehouse employee and the accountant had unrestricted access to post vendor bills, which caused BILL-9903 to be entered twice for the same shipment. The issue was only detected on March 31, after an unusual increase in Accounts Payable exceeded expected balances.
Root Cause: Permissions were not role-based and there was no authorization matrix defining who could approve or post transactions at each level, leaving the process fully dependent on individual judgment.

Problem 4 - Sourcing Problems Reduced Actual Product Profitability

Several products appeared profitable based on sales volume, but actual profit margins were significantly lower after considering supplier pricing, urgent shipping, and landed costs.
2 imported products (Portable Nebulizer and Pulse Oximeter) were sourced from expensive and logistically distant suppliers, increasing procurement and urgent shipping costs.
Root Cause: Procurement decisions were based mainly on availability rather than total landed cost and supplier proximity.
Additionally, replenishment was not aligned with seasonal demand, causing urgent shipments and higher freight expenses.

Product	Supplier Change / Action	Main Benefit
Portable Nebulizer (NEB-P01)	U.S. Supplier → Egy-Med (Egypt)	Decreased cost per unit from 85 JD to 68 JD with lower landed cost and faster delivery
Pulse Oximeter (PULSE-O3)	U.S. Supplier → Rossmax (Turkey)	Reduced freight and procurement cost
Digital Thermometer (THERM-05)	Seasonal reordering rules applied (Nov- Feb)	Better inventory availability during peak demand
Surgical Masks (MASK-S1)	reordering rules applied	Better stock availability and reduced emergency purchasing
Nitrile Gloves (GLV-B2)	reordering rules applied	Better stock availability and reduced emergency purchasing
Blood Glucose Strips (STRP-2241)	Demand-based replenishment	Improved inventory turnover

🔷 These issues were identified during a comprehensive internal audit conducted in Q1 2026, as part of transitioning to Odoo ERP. Prior to system implementation, no centralized controls existed.

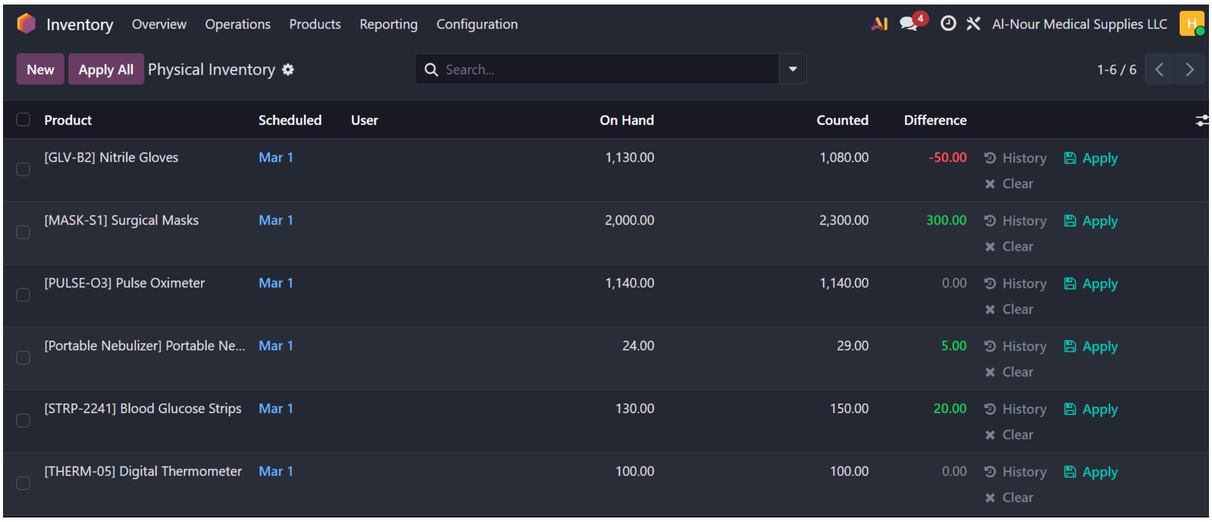
Proposed Solutions in Odoo 19

1. Physical Inventory Reconciliation & Inventory Adjustment

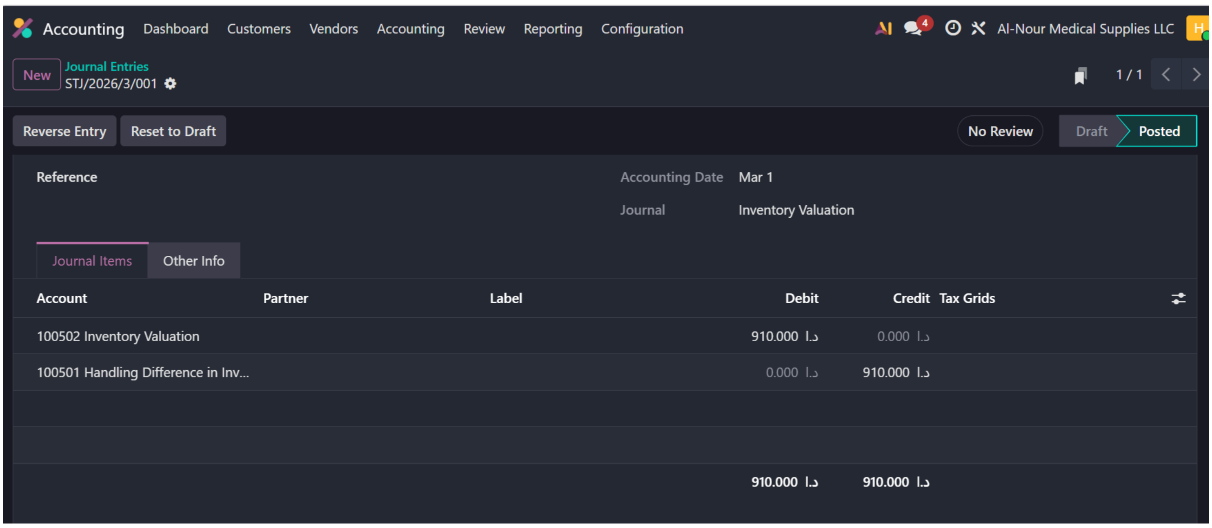
Inventory module Cycle count Addresses Problem 1

The first step before go-live was making sure the system reflected reality. A full physical count was conducted across all products, and inventory adjustments were posted directly in Odoo to close the 910 JOD gap. The journal entry below shows the adjustment posted to the Inventory Valuation account, correcting the Balance Sheet from day one.

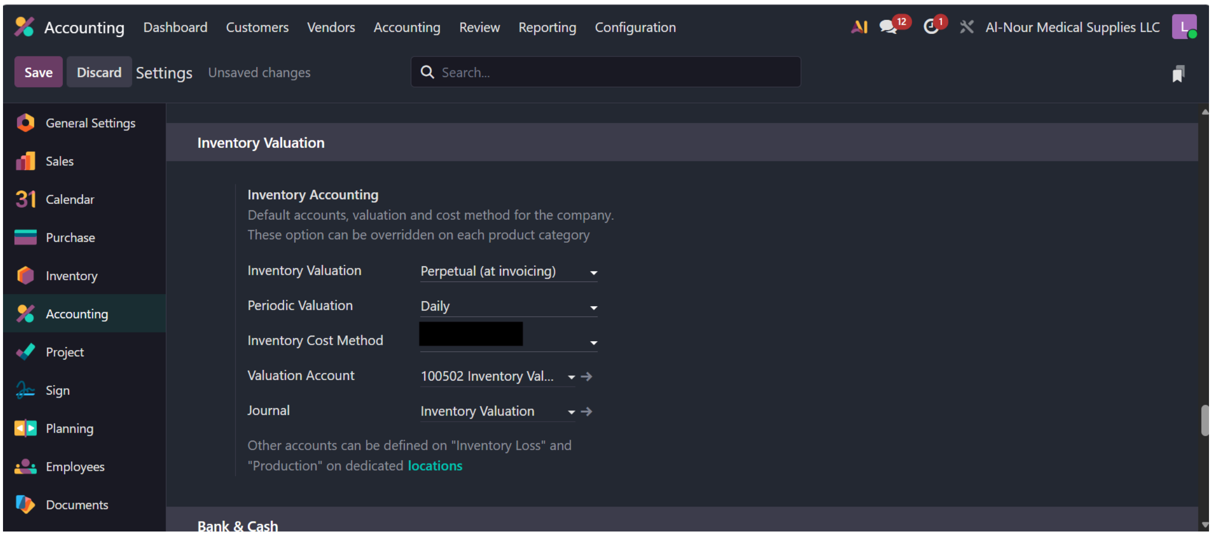
Screenshot 1: Physical Inventory count showing system vs. counted quantities and differences



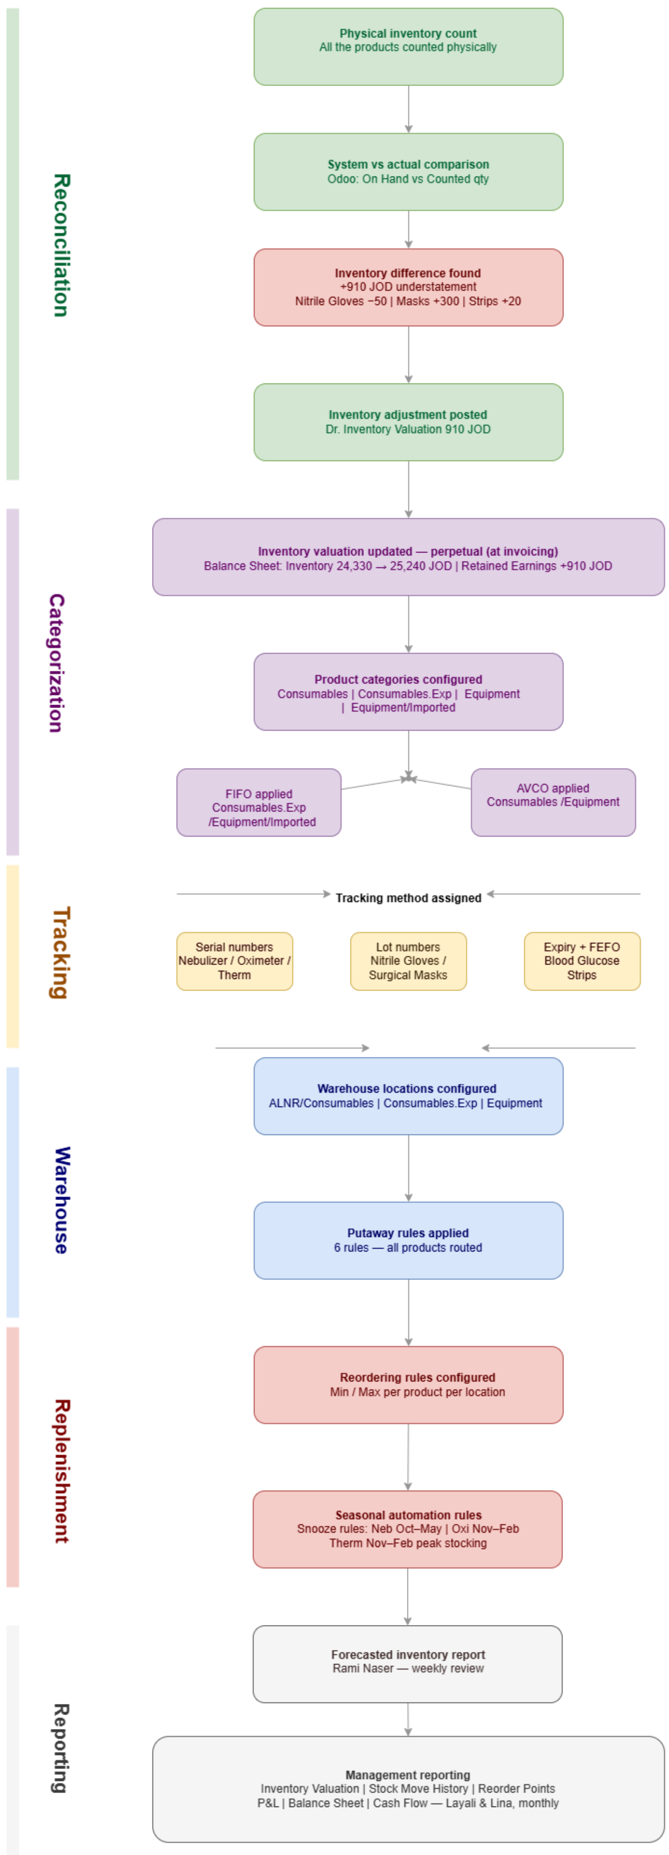
Screenshot 2: Journal entry — Dr. Inventory Valuation 910 JOD / Cr. Handling Difference in Inventory 910 JOD



Screenshot 3: Accounting settings showing Perpetual valuation configured



The flowchart below provides an overview of the inventory control framework implemented in Odoo 19 following the reconciliation process. It summarizes how inventory valuation, product categorization, traceability, warehouse controls, replenishment planning, and reporting work together to maintain inventory accuracy and operational visibility.



Reconciliation
Physical inventory count
All the products counted physically
System vs actual comparison
Odoo: On Hand vs Counted qty
Inventory difference found
+910 JOD understatement
Nitrile Gloves −50 | Masks +300 | Strips +20
Inventory adjustment posted
Dr. Inventory Valuation 910 JOD

1.1 Product Traceability - Serial Numbers, Lots, and Expiry Tracking

Different tracking methods were implemented based on product value, movement frequency, and operational risk.

High-value medical equipment was configured with **Serial Number tracking** to monitor each individual unit and improve traceability during sales, returns, and warranty handling.

Fast-moving consumables were configured with **Lot Numbers** to improve batch control and warehouse visibility.

Products with expiry sensitivity were configured with **Expiration Date tracking** and FEFO removal logic to minimize expiry-related losses.

Product	Tracking Method
Portable Nebulizer (NEB-P01)	Serial/NEB-2026-001-NEB-2026-025
Pulse Oximeter (PULSE-O3)	Serial/OXI-2026-0030000001-OXI-2026-0030000800
Digital Thermometer (THERM-05)	Serial/THM-2026-0030000001-THM-2026-0030000085
Nitrile Gloves (GLV-B2)	LOT-GLV-2026-010000001
Surgical Masks (MASK-S1)	LOT-MASK-202603
Blood Glucose Strips (STRP-2241)	LOT-STRP-202601 Exp Feb 29, 2028

This structure improved stock visibility, product traceability, and inventory accuracy across warehouse operations.

1.2 Inventory Categories & Inventory Valuation

Products were grouped into structured categories with appropriate costing methods, ensuring that inventory valuation moves automatically with every transaction rather than relying on manual updates.

Category	Products	Costing Method	Inventory Valuation
Consumables with Expiry Dates	Blood Glucose Strips	FIFO	Perpetual (at invoicing)
Consumables	Surgical Masks/ Nitrile Gloves	AVCO	Perpetual (at invoicing)
Medical Equipment-Parent	Digital Thermometer	AVCO	Perpetual (at invoicing)
Medical Equipment/Equipment Imported	Portable Nebulizer/ Pulse Oximeter	FIFO	Perpetual (at invoicing)

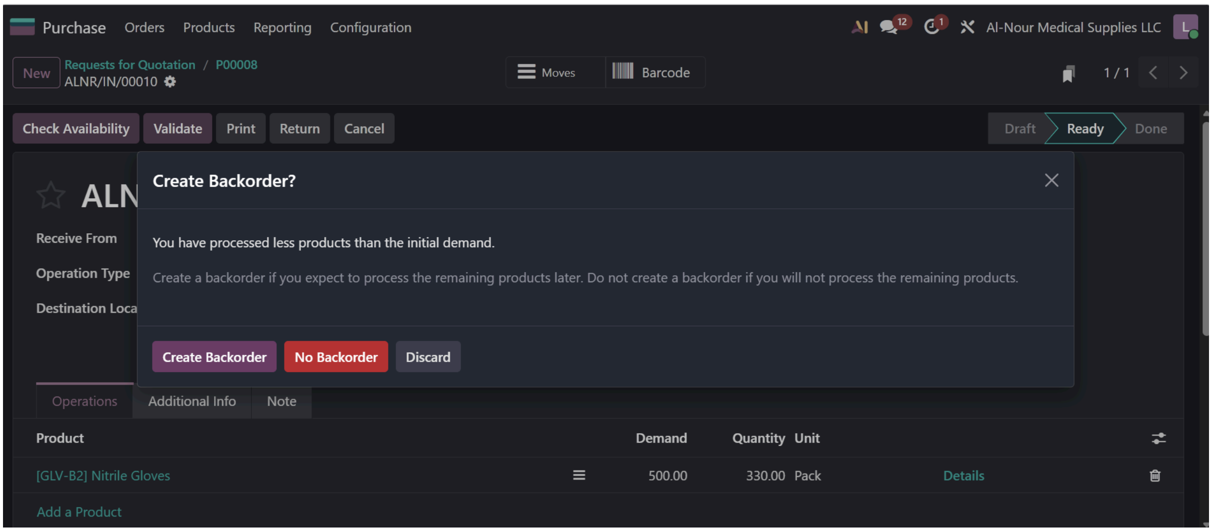
FIFO was applied to products where cost layers matter, either because of expiry risk or because unit costs vary significantly between import batches. AVCO was used for standard consumables where average cost is a stable and practical measure.

1.3 Receipt Validation Controls

The core issue behind the Nitrile Gloves overstatement was that staff were confirming receipts based on what was ordered, not what physically arrived. Under the new process, warehouse staff must enter and validate the actual received quantity before the system updates stock levels.

The screenshot below shows this control in action. When 330 units of Nitrile Gloves were received against a demand of 500, Odoo flagged the shortfall and prompted the operator to decide whether to create a backorder for the remaining quantity, preventing the system from silently recording 500 units as received.

Screenshot 4: Backorder prompt showing demand of 500 vs. quantity received of 330 for Nitrile Gloves



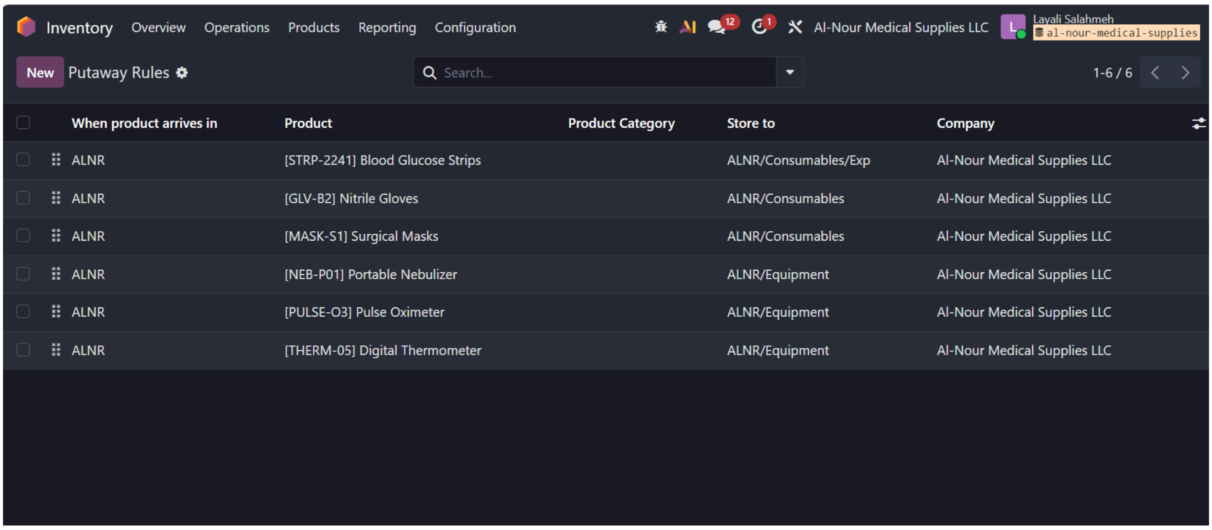
1.4 Warehouse Structure & Putaway Rules

Warehouse locations were restructured under a single ALNR parent location, with dedicated child locations by product type and storage requirement. Stock transfers are now blocked until receipts are validated inside the system, eliminating the previous practice of moving products to shelves before any record was created.

Location	Type	Category	Products	Force Removal Strategy
ALNR/Consumables/Exp	Internal	Consumables with Expiry Date	Blood Glucose Strips	First Expiry First Out (FEFO)
ALNR/Consumables	Internal	Consumables	Surgical Masks/ Nitrile Gloves	First In First Out (FIFO)
ALNR/Equipment	Internal	Medical Equipment-Parent	Digital Thermometer	First In First Out (FIFO)
ALNR/Equipment	Internal	Medical Equipment/ Equipment/Imported	Portable Nebulizer/ Pulse Oximeter	First In First Out (FIFO)

Putaway Rules were configured to route each product automatically to its determined location upon receipt, removing the need for manual placement decisions. The screenshot below shows all six rules active in Odoo, covering every product in the warehouse.

Screenshot 5: Putaway Rules screen showing all products routed to their correct ALNR locations



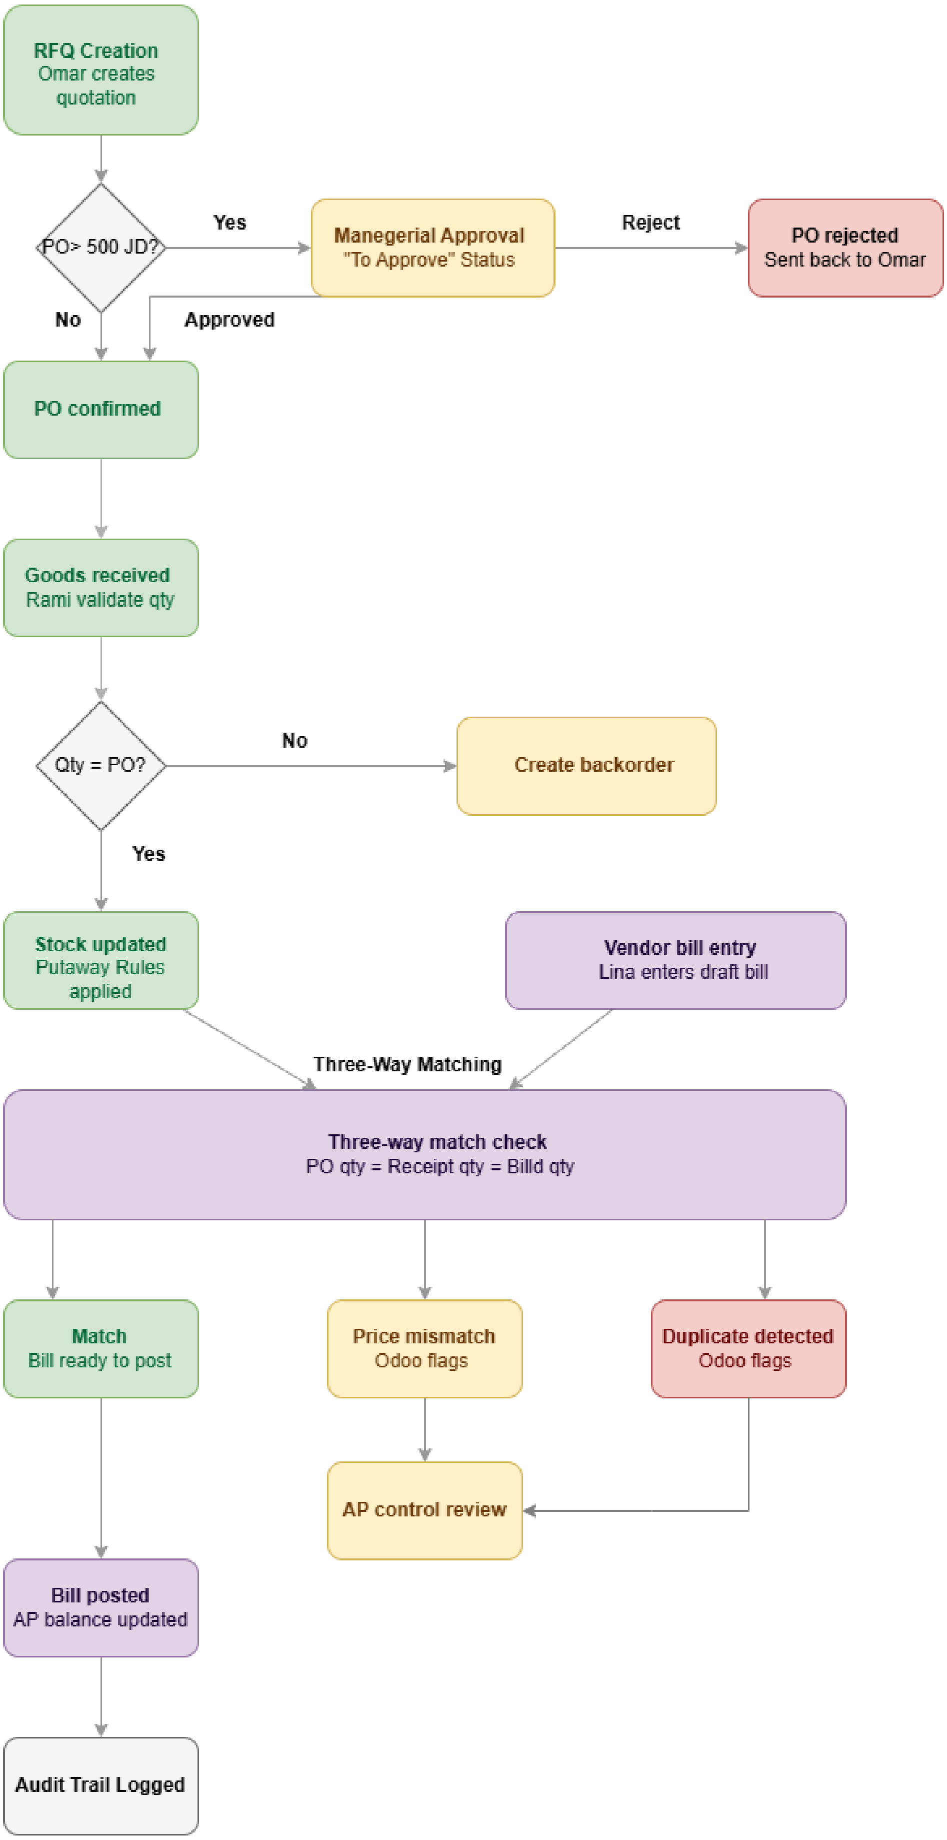
This reduced manual warehouse decisions, improved stock organization, and minimized misplaced inventory during receiving operations.

2. Procurement Controls & Vendor Bill Verification

Purchase module Vendor Bills Addresses Problem 2

To resolve the 1,925 JOD in Accounts Payable discrepancies caused by duplicated vendor bills and unapproved supplier fees (the unauthorized training fee on PO-2026-002), Al-Nour enforced a strict **Three-Way Matching** mechanism in Odoo.

The flowchart below illustrates the end-to-end procurement control process implemented in Odoo 19, from purchase approval through receipt validation, vendor bill verification, and audit trail logging.



RFQ Creation
Omar creates quotation
PO> 500 JD?
Yes
Manegerial Approval
"To Approve" Status
Reject
PO rejected
Sent back to Omar

Three-Way Matching
Three-way match check
PO qty = Receipt qty = Billd qty
Match
Bill ready to post
Price mismatch
Odoo flags
Duplicate detected
Odoo flags
AP control review
Bill posted
AP balance updated
Audit Trail Logged

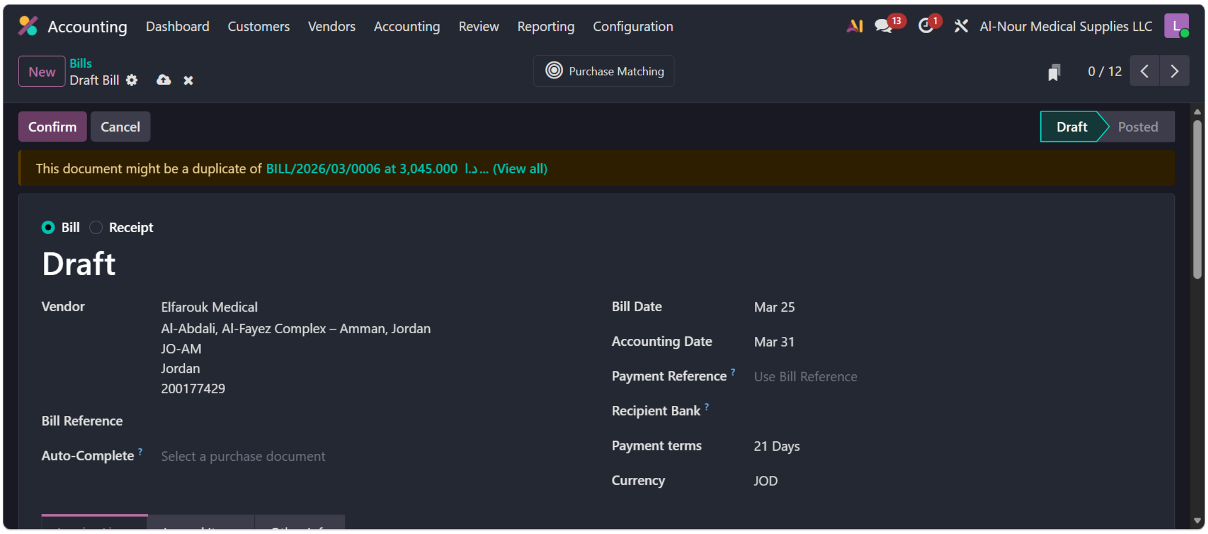
2.1 Three-Way Matching Implementation

Odoo now cross-references three distinct documents before allowing any financial posting: **The Purchase Order, the Receiving Receipt, and the Vendor Bill.**

Bill Control Policy: The control policy for all product categories was set to **Based on Delivered Quantities**.

- **Discrepancy Control:** If a supplier bills for units that were never received (such as the 50-unit shortage of Nitrile Gloves) or increases the unit cost without prior PO approval, Odoo flags the bill as a **Mismatch** and blocks the payment workflow until procurement reviews it. *[As shown at Screenshot 4: Backorder prompt showing demand of 500 vs. quantity received of 330 for Nitrile Gloves]*
- **Duplicate Prevention:** Odoo checks the Vendor Bill Reference and date on every entry. The screenshot below shows this control catching a real duplicate in the system. When the same bill was entered a second time, Odoo immediately flagged it as a potential duplicate of BILL/2026/03/0006, blocking the entry before it was posted and preventing the AP overstatement entirely.

Screenshot 6: Draft bill showing Odoo's duplicate warning — "This document might be a duplicate of BILL/2026/03/0006"



3. Automated Approval Workflows & Audit Trails

Purchase settings Accounting Addresses Problem 3

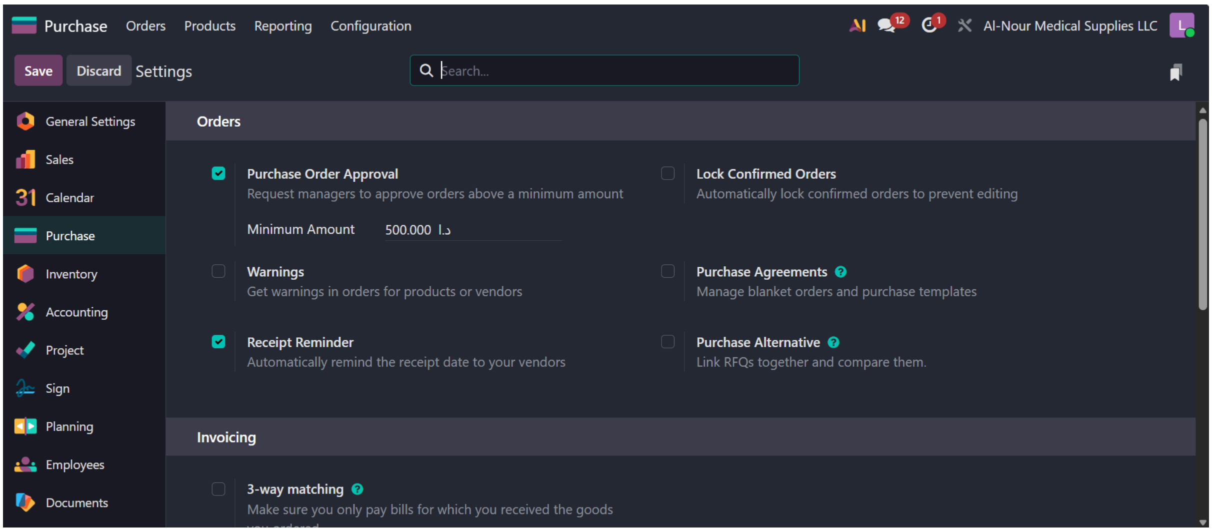
Verbal and WhatsApp approvals were completely replaced by automated, system-enforced validation chains within Odoo's Purchase module, securing internal control over company cash flow.

3.1 Purchase Order Approval Matrix

Unrestricted access to post bills and approve orders was revoked. A digital approval matrix was established based on financial thresholds:

- **Purchase Representative Level:** Can create requests for quotations (RFQs) and confirm orders up to **500 JOD** independently.
- **Managerial Approval:** Any PO exceeding **500 JOD** is automatically placed in a `To Approve` status. Odoo locks the order and sends an automated notification to the Finance Manager for digital signature and approval.

Screenshot 7: Purchase settings showing Purchase Order Approval enabled with 500 JOD minimum amount and 3-way matching configured under Invoicing



3.2 Audit Trail & Chatter Log

Every transaction in Odoo generates an unalterable **Audit Trail** via the native **Chatter** feature at the bottom of each document. The system automatically records:

- The exact user who created, modified, or approved a PO or Vendor Bill.
- The exact timestamp of the action.
  This ensures full transparency for future tax audits, and completely eliminates employee's mistake.

4. Strategic Sourcing & Demand-Driven Replenishment

Studio Customization for Demand-Driven Replenishment & Reporting Landed cost Address Problem 4

The margin issue was not a sales problem. Revenue was healthy, but procurement decisions were made based on availability alone, without visibility into total landed cost. The fix required two things: changing where products were sourced from, and making sure stock levels were driven by actual demand patterns rather than manual judgment.

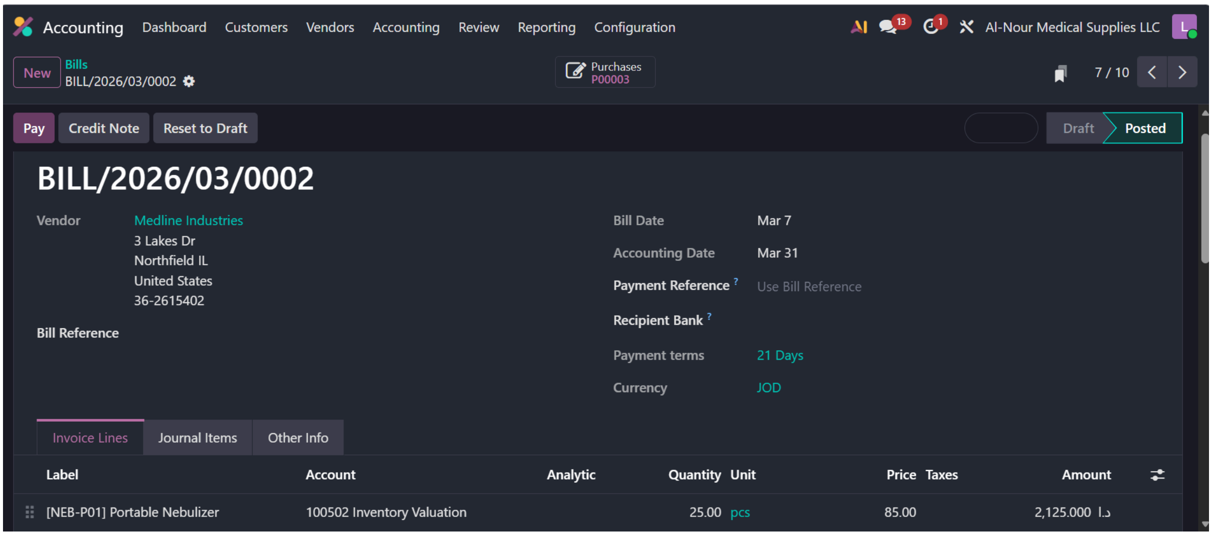
4.1 Supplier Sourcing Optimization

Procurement strategy was shifted from simple availability to **Total Landed Cost** and geographical proximity:

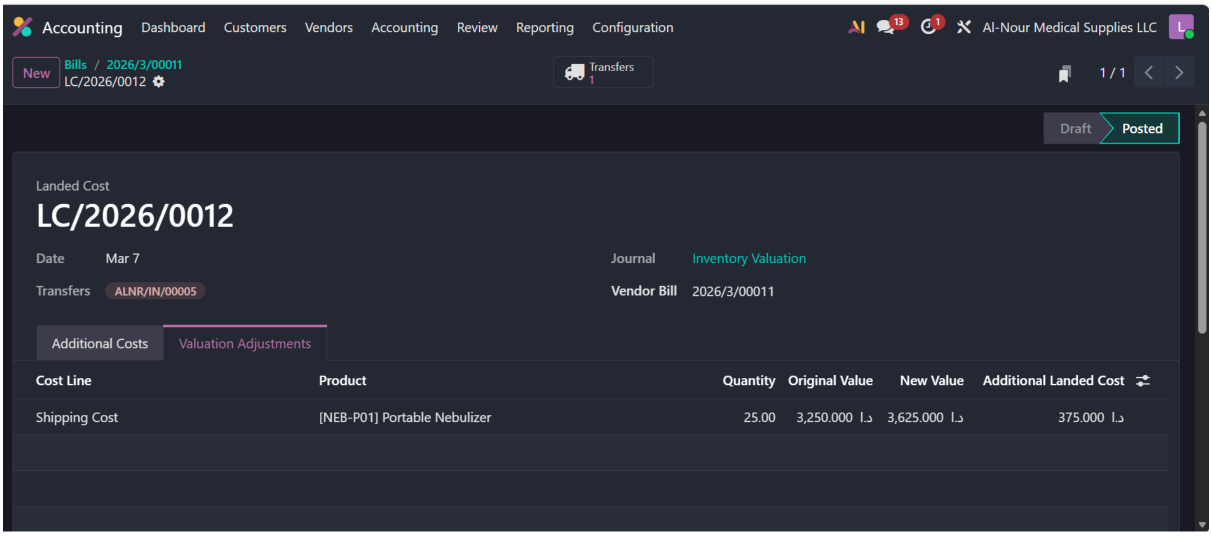
- **Portable Nebulizer:** sourcing was moved from a U.S. supplier to **Egy-Med (Egypt)** . The base unit cost dropped from 85 to 68 JOD, and maritime freight costs were significantly reduced due to the shorter shipping distance. The two screenshots below show the before and after: the first bill from Medline Industries at 85 JOD per unit with a landed cost of 375 JOD added on top, and the second bill from Egy-Med at 68 JOD per unit with a landed cost of only 140 JOD. The total cost per unit came down, and the gross margin on this product improved from 13% to 36%.
- **Pulse Oximeter:** Sourcing was shifted from the U.S. to **Rossmax (Turkey)**, reducing shipping lead times and importing expenses.

Product	Before Optimization	After Optimization	Main Improvement
Portable Nebulizer	13% Margin	36% Margin	Lower landed cost + better sourcing
Pulse Oximeter	46.6% Margin	48% Margin	Reduced freight allocation and lead time

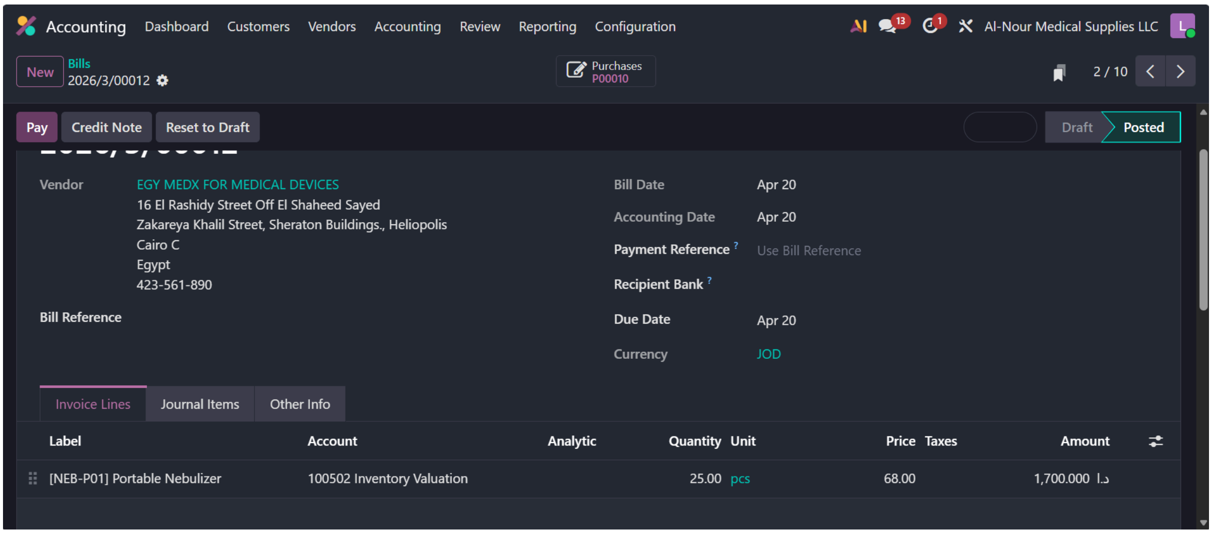
Screenshot 8: BILL/2026/03/0002 from Medline Industries — 25 units of Portable Nebulizer at 85 JOD = 2,125 JOD



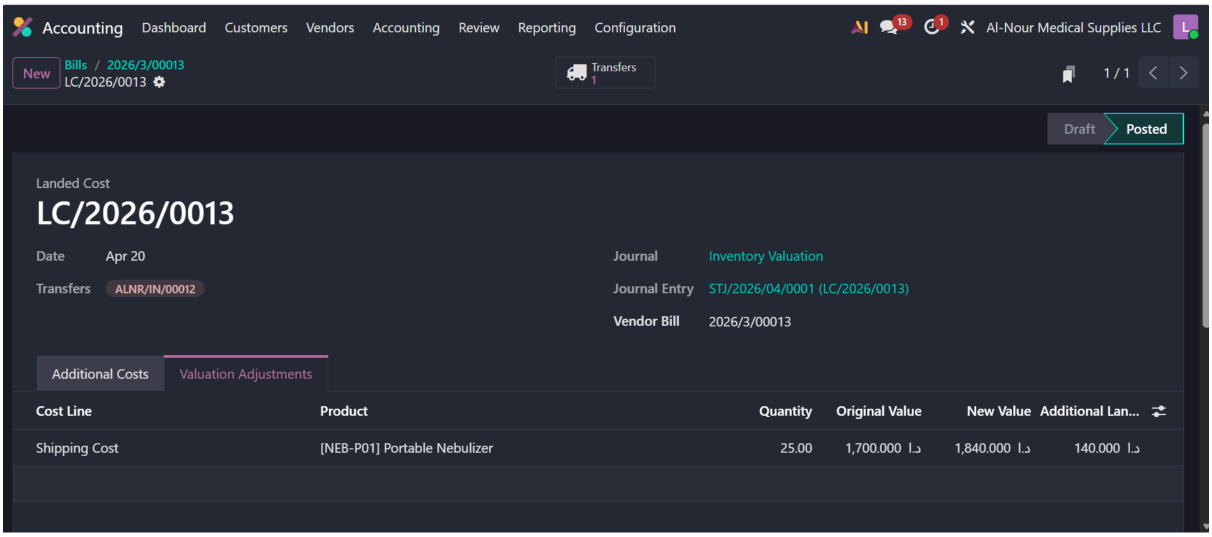
Screenshot 9: LC/2026/0012 — Landed Cost for Medline shipment showing shipping cost of 375 JOD added to original value of 3,250 JOD



Screenshot 10: Bill from EGY MEDX — 25 units of Portable Nebulizer at 68 JOD = 1,700 JOD



Screenshot 11: LC/2026/0013 — Landed Cost for Egy-Med shipment showing shipping cost of only 140 JOD added to original value of 1,700 JOD

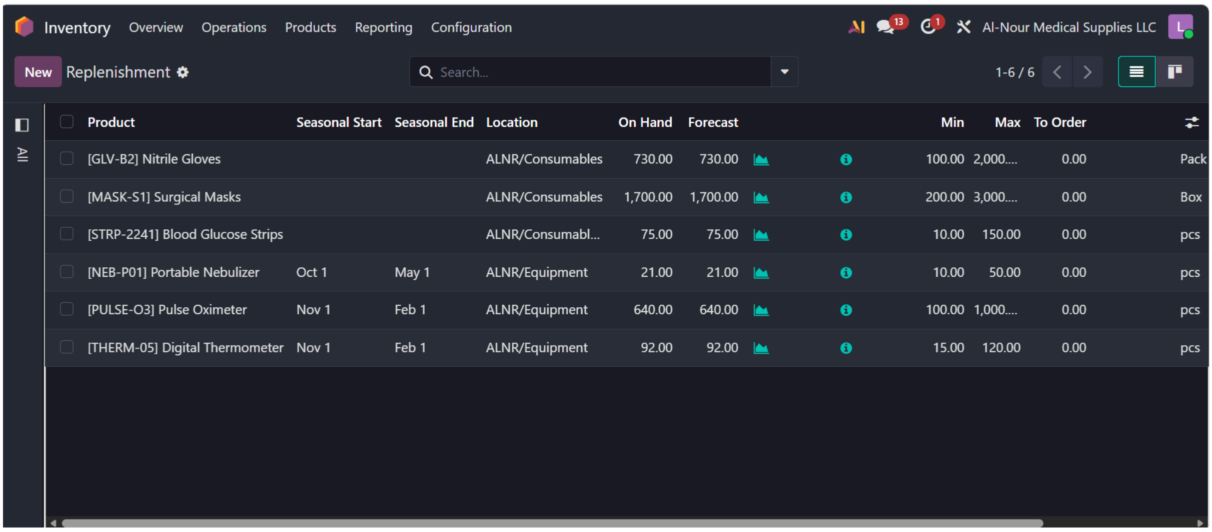


4.2 Automated Reordering Rules (Automated Replenishment)

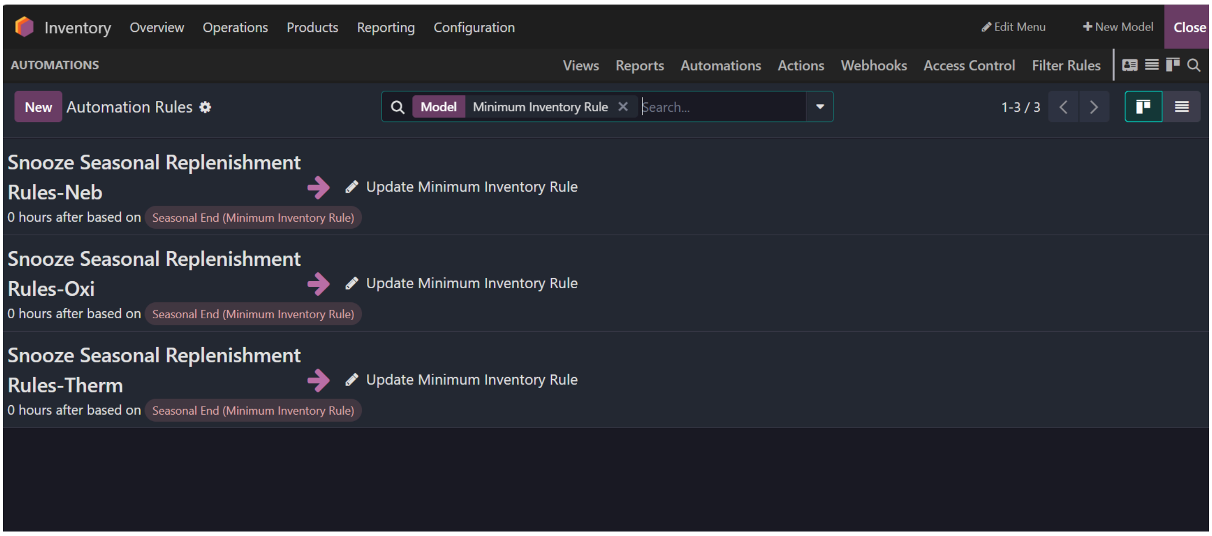
To eliminate emergency purchasing and minimize urgent shipping fees, **Automated Reordering Rules (Min/Max)** were configured based on lead times and product turnover rates:

- **Seasonal Demand Alignment:** For the **Digital Thermometer**, reordering rules were set to dynamically trigger higher stock levels ahead of peak seasonal demand (November – February), ensuring availability without overstocking during off-peak months.
- **Fast-Moving Consumables:** Surgical Masks and Nitrile Gloves were assigned optimized safety stock levels based on their 30-45 day turnover cycle, triggering automated RFQs to suppliers before stockouts occur, ensuring a continuous, cost-effective supply chain.

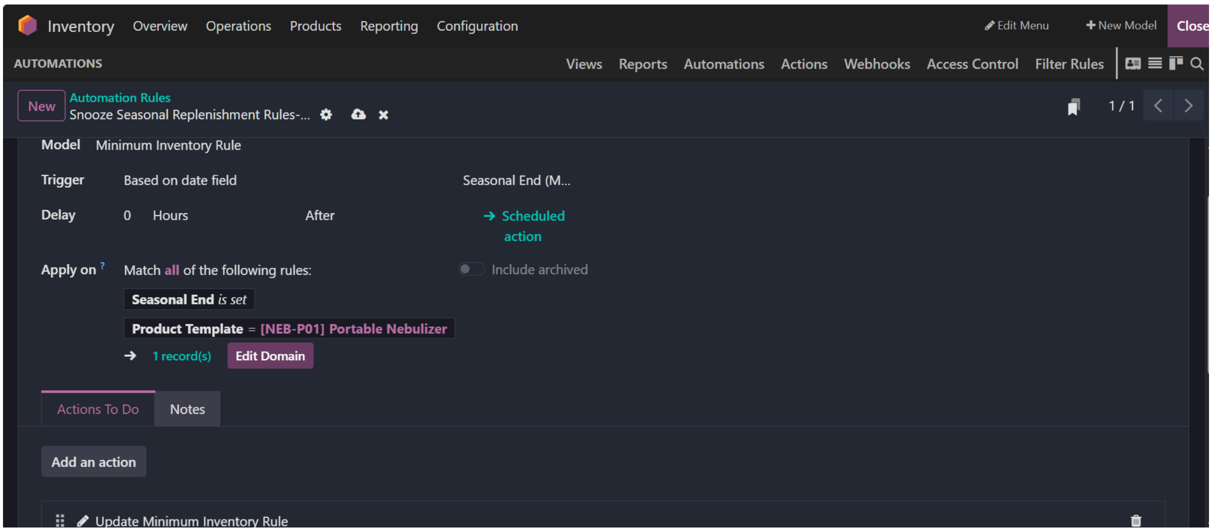
Screenshot 12: Replenishment screen showing all 6 products with Min/Max levels, Seasonal Start/Seasonal End, and stock levels per location



Screenshot 13: Studio Automation Rules list showing three active rules — Snooze Seasonal Replenishment for Neb, Oxi, and Therm



Screenshot 14: Automation rule detail for Portable Nebulizer — trigger based on Seasonal End date, action updates Minimum Inventory Rule



4.3 Adapting with Seasonal Revenue Breakdown

- **Peak Season:** Revenue reaches **40,000 to 45,000 JOD**, heavily driven by seasonal items like *nebulizers, thermometers, and pulse oximeters*. However, despite high sales, these products yield lower profit margins due to high acquisition costs.
- **Off-Peak Season (June – September):** Revenue drops significantly to **12,000 – 15,000 JOD**. During this period, sales rely almost entirely on year-round essentials like *glucose strips, gloves, and masks*, which are stable but not enough to sustain strong revenue alone.

Strategic Recommendation

To stabilize cash flow and maximize summer revenue, the company should shift from a reactive inventory model to a strategic one:

- **Minimize Capital Tied in Low-Demand Stock:** Reduce summer inventory for *nebulizers, thermometers, and pulse oximeters* to the absolute minimum required.
- **Reallocate Capital to High-Margin Alternatives:** Reinvest the freed-up capital into high-demand, clinic-focused products that ensure steady summer sales, such as:
  - Advanced wound care supplies
  - Blood pressure monitors
  - ECG machines
  - Medical kits (for healthcare staff)

Financial Statements

Balance Sheet - *For the period ending March 31, 2026*			
	Before (JOD)	**After (JOD)**	**Adjustment**

Bank Loan Payable	20,000.00	20,000.00	-
Total Long-term Liabilities	**20,000.00**	**20,000.00**	-
TOTAL LIABILITIES	**52,069.90**	**50,144.90**	**1,925.00**
Equity			
Owner's Capital	31,000.00	31,000.00	-
Retained Earnings	46,057.00	48,910.00	2,835.00
Total Equity	**77,075.00**	**79,910.00**	**2,835.00**
TOTAL LIABILITIES AND EQUITY	**129,144.90**	**130,054.90**	**910.00**

Balance Sheet - *For the period ending March 31, 2026*
! Key Adjustments: Inventory +910 JOD │ AP reduction reflects a reversed invoice before payment - no cash outflow occurred

Income Statement

Income Statement ***For the period ending March 31, 2026***		
	Before (JOD)	**After (JOD)**
REVENUE		
Revenue	135,155.00	135,155.00
Sales Account	135,155.00	135,155.00
COST OF GOODS SOLD		
Opening Inventory	9,107.50	9,107.50
Purchases	85,582.50	85,582.50
Landed Cost	935.00	935.00
Closing Inventory	(24,330.00)	(25,240.00)
Total COGS	71,295.00	70,385.00
Gross Profit	63,860.00	64,770.00
OPERATING EXPENSES		
Basic Salary	14,700.00	14,700.00
Warehouse Rent	1,980.00	660.00
Other Utility Charges	500.00	500.00
Depreciation	405.00	405.00
Total Operating Expenses	**16,265.00**	**16,265.00**
ADJUSTMENTS (ERP Migration Review)		
Inventory adjustment gain	—	+910.00 (Included)
Net Income	47,595.00	48,505.00
The 910 JOD inventory adjustment is reflected through Closing Inventory in COGS. The 1,925 JOD AP discrepancy does not affect the Income Statement as no payment was made, it was reversed directly on the Balance Sheet.		

! The adjustments impacted valuation and liabilities only, with no direct cash flow effect.

Management Reporting & KPIs

Before Odoo 19, reporting at Al-Nour relied on Excel sheets and manual follow-ups between departments. Financial and operational data was fragmented, making reporting slow and sometimes inconsistent.

After implementation, Odoo centralized reporting across Inventory, Purchase, Accounting, and Sales, giving management and department heads real-time visibility into operations and financial performance from one system.

At this stage, Odoo adoption was limited to department heads and key operational users only. Management chose a gradual rollout approach to reduce resistance to the new system and allow employees to adapt progressively before expanding usage across the company.

Report	Menu Path	Used By	Frequency
Inventory Valuation	Inventory > Reporting > Inventory Valuation	Layali Salahmeh / Lina Haddad	Monthly
Stock Move History	Inventory > Reporting > Moves Analysis	Rami Naser / Omar Saleh	Weekly
Reorder Points Report	Inventory > Reporting > Forecasted Inventory	Rami Naser	Weekly
Aged Payables	Accounting > Reporting > Partner Reports > Aged Payable	Lina Haddad	Monthly
Aged Receivables	Accounting > Reporting > Partner Reports > Aged Receivable	Lina Haddad	Monthly
Profit & Loss	Accounting > Reporting > Profit and Loss	Layali Salahmeh	Monthly
Balance Sheet	Accounting > Reporting > Balance Sheet	Layali Salahmeh / Lina Haddad	Monthly
Cash Flow Statement	Accounting > Reporting > Cash Flow Statement	Layali Salahmeh	Monthly
Purchase Analysis	Purchase > Reporting > Purchase Analysis	Omar Saleh / Layali Salahmeh	Monthly

Management KPIs Setup

Management reporting was centralized through Odoo's Accounting, Inventory, Sales, and Purchase reporting menus, allowing department heads to monitor key operational and financial KPIs in real time.

The KPIs included:

- Current Cash & Bank Balances
- Overdue Vendor Bills
- Outstanding Customer Invoices
- Low Stock Alerts
- Monthly Revenue vs. Target

Testing & Go Live

Before deployment, procurement, inventory, and accounting workflows were tested inside a controlled Odoo environment to verify approval controls, user permissions, and financial accuracy before go-live.

User Acceptance Testing (UAT)

#	Test Scenario	Expected Result
1	Create RFQ for Portable Nebulizer at 90 JOD	Odoo warns that billed price differs from approved PO
2	Create PO exceeding 500 JOD without approval	PO remains in `To Approve` status
3	Layali approves PO, then user attempts price modification	Price field becomes locked
4	Receive 20 Portable Nebulizers against PO quantity of 25	Odoo creates backorder
5	Post vendor bill with duplicate reference number	Odoo displays duplicate warning
6	Run stock adjustment for Blood Glucose Strips	Inventory valuation updates automatically
7	Attempt to modify posted journal entry	System blocks modification
8	Generate Q1 2026 Profit & Loss Statement	Net Income equals 48,505.00 JOD

#	Test Scenario	Expected Result
9	Review Aged Payables report	Duplicate and overbilled entries reversed
10	Omar accesses Accounting as Purchase User	Access denied

This testing confirmed that approval workflows, inventory controls, and accounting restrictions were functioning correctly before deployment.

Cutover & Go-Live Strategy

To reduce operational disruption and employee resistance, Al-Nour adopted a gradual ERP rollout instead of replacing all manual processes immediately.

Timeline	Activity
Day -5	Freeze Excel entries
Day -4	Enter opening balances and reconciled inventory
Day -3	Conduct user training sessions
Day -2	Run Odoo and Excel in parallel
Day -1	Reconcile balances and validate reports
Day 0	Odoo becomes the primary operational system

First-Month Post Go-Live Controls

During the first month after go-live, department heads performed regular monitoring procedures to ensure process stability.

Daily Controls

- Review purchase orders in `To Approve`
- Check vendor bill mismatch warnings
- Monitor low-stock alerts
- Perpetual Inventory Valuation (Purchase & Sales)

Weekly Controls

- Reconcile Inventory Valuation with physical stock
- Review Aged Payables
- Validate replenishment rules

Month-End Controls

- Lock the accounting period
- Generate financial statements
- Review approval history and audit trails

Conclusion

The Odoo 19 ERP implementation at Al-Nour Medical Supplies LLC successfully transformed a fragmented, manual trading operation into an integrated, data-driven ecosystem. By replacing legacy Excel tracking and verbal workflows with automated system controls, the project achieved immediate financial clarity and established a scalable foundation for sustainable business growth.

Financial Impact Summary

The core financial outcome of the ERP migration review was the immediate identification and resolution of **2,835 JOD** in cumulative financial misstatements prior to system go-live:

- **Asset Accuracy:** A physical-to-system reconciliation corrected a **910 JOD** inventory valuation understatement, ensuring the Balance Sheet accurately reflects true current assets.
- **Liability Optimization:** Enforcing strict Three-Way Matching successfully eliminated **1,925 JOD** in unauthorized supplier billing and duplicate invoices before any cash outflow occurred.
- **Margin Protection:** Automating Landed Cost allocation stopped internal profitability leakage, allowing true product margins to become fully visible to management.

Operational Transformation

Beyond the numbers, internal controls were elevated across all critical business processes:

- **Procurement Governance:** Unrestricted purchasing and verbal/WhatsApp requests were replaced by a structured **Purchase Order Approval Matrix**, forcing system validation for any transaction exceeding 500 JOD.
- **Supply Chain Efficiency:** Transitioning to **Demand-Driven Replenishment** via Odoo Studio automation rules aligned stock levels with peak seasonal cycles, minimizing off-season capital stagnation and preventing stockouts.
- **Strategic Sourcing:** Utilizing real-time data to shift key product sourcing (e.g., Portable Nebulizers to Egy-Med) significantly lowered procurement and freight expenses, directly optimizing gross profit performance.
- **Audit Readiness:** Every logistical and financial transaction now generates an unalterable, system-enforced audit trail via the native **Chatter log**, ensuring total regulatory and internal accountability.

Final Takeaway

This implementation proves that digital transformation is not merely a software upgrade, but a strategic realignment of business operations. Al-Nour Medical Supplies LLC now operates with absolute financial transparency, tighter internal risk controls, and a robust functional architecture capable of supporting higher transaction volumes and future market expansion without a linear increase in administrative overhead.
